

Behind the Project

Trader's Journal

A modern trading journal that combines structured trade documentation, psychology tracking and AI-powered post-session analysis.

Project Overview

Trader's Journal was created as a concept for a modern trading journal that helps traders analyse not only **what** happened during a trading session, but also **why** it happened.

The application combines structured trade documentation, trading psychology, performance tracking and AI-assisted analysis into a single workflow. The primary goal is to minimise manual documentation while making post-session reviews faster, more organised and more valuable for long-term improvement.

While existing platforms such as TradeZella inspired some aspects of digital trade journaling, this project explores a different approach by placing greater emphasis on trading psychology, structured reflection and AI-assisted review.

The Challenge

Many existing trading journals focus primarily on statistics and historical trade data. Although valuable, they often require users to manually organise information across multiple sections, making the review process time-consuming.

This project was designed to simplify that workflow by combining:

- structured trade documentation
- session preparation
- trading psychology
- visual trade analysis
- AI-assisted review
- long-term performance tracking

into one consistent user experience.

Design Approach

The project was built around three core principles.

Simplicity

The interface was designed to feel clean, modern and intuitive rather than resembling a traditional trading platform. The goal was to encourage consistent journaling without overwhelming users with unnecessary complexity.

Privacy First

All journal data is stored locally, allowing users to maintain complete control over their information without requiring accounts or cloud storage.

AI as a Productivity Tool

Rather than replacing trader decisions, AI is used to significantly reduce the time required to document and analyse an entire trading session.

Technologies

- HTML
 - CSS
 - JavaScript
 - IndexedDB
 - Claude AI
 - ChatGPT
-

Key Features

- Interactive Dashboard
 - Session Preparation
 - AI Review Workspace
 - Trade Analysis
 - Performance Statistics
 - Trading Rules Library
 - Trading Psychology Journal
 - Trading Calendar
 - Local-first Architecture
 - JSON Import & Export
-

Final Thoughts

This project was created to demonstrate more than front-end development.

It showcases product thinking, workflow optimisation and practical AI integration by focusing on a real user problem: reducing friction in post-session analysis while improving the quality of reflection.

The result is a journal designed to help traders spend less time on repetitive documentation and more time improving their decision-making through structured, AI-assisted reviews.
